

# GOOD MORNING GAMERS

## IT'S MICHAEL, BACK AT IT AGAIN

## WITH ANOTHER FORTNITE VID-

### CREDENTIALS SETUP:

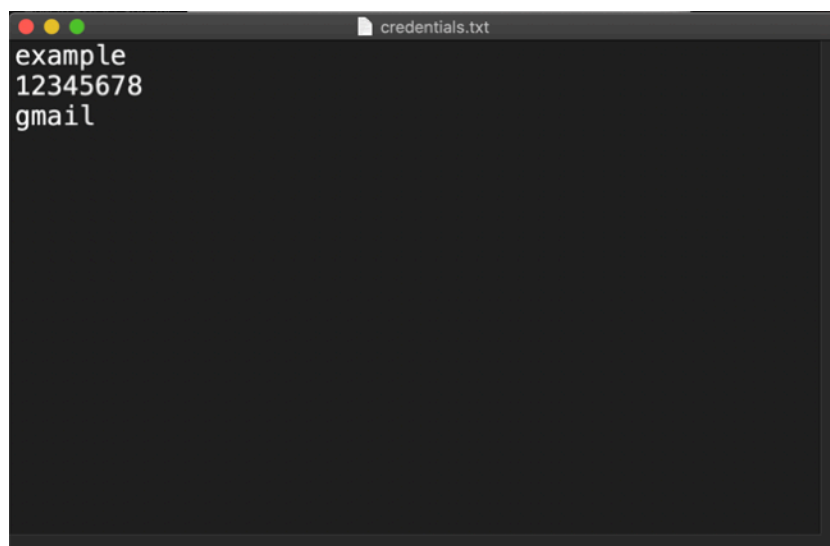

To use your own email for spamming purposes, open the **credentials.txt** file and fill in the following information:

Line 1: email Username

Line 2: email *App Password* (read below if you don't know where to find this)

Line 3: email domain (ex. gmail, yahoo etc.)

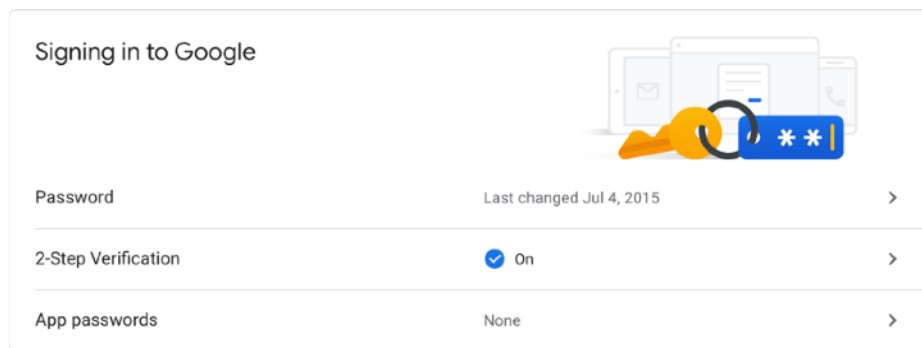

Example: if my email address was example@gmail.com and my password was 12345678, then my credentials.txt file would look like this:

```
example
12345678
gmail
```

## Setup instructions for Gmail:

- 1) Log into your account on any web browser
- 2) Click on your profile and click on “Manage your Google Account”
- 3) Go to the 'Security' tab
- 4) Turn on 2-Step Verification

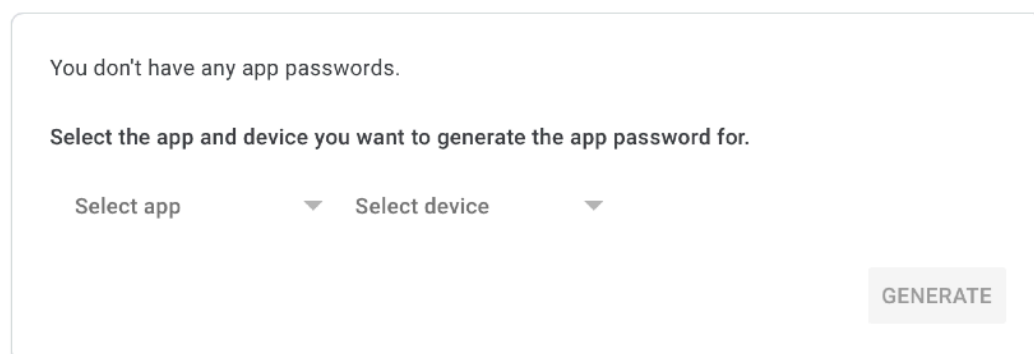

Signing in to Google		
Password	Last changed Jul 4, 2015	>
2-Step Verification	<input checked="" type="checkbox"/> On	>
App passwords	None	>

- 5) Turn on "*App Passwords*"
- 6) You may be prompted by the screen below.

### ← App passwords

App passwords let you sign in to your Google Account from apps on devices that don't support 2-Step Verification. You'll only need to enter it once so you don't need to remember it. [Learn more](#)

You don't have any app passwords.

Select the app and device you want to generate the app password for.

Select app ▼    Select device ▼

GENERATE

- For “Select app”, click on “Other (*Custom Name*)” and enter whatever your heart desires (I just wrote “Python”)
- For “Select device”, select the device you’re currently on

Click “GENERATE”, and that’s your *App Password*! Make sure to put it on line to of the **credentials.txt** file

## AFTER DOWNLOADING THE ZIP FILE

- 1) Save the ENTIRE **EmailSpammer** folder to your **Documents** directory

(This part is VERY important.

After doing this, you should be able to open **Documents**, find the **EmailSpammer** folder, double click it, and find a .txt, .pdf, .py and .command)

- 2) Open **Terminal**, and type in the following two commands, one line at a time (make sure you hit enter):

```
cd Documents/EmailSpammer  
chmod +x EmailSpammer.command
```

Your terminal should look like this:

```
(base) Chikn:~ michaelxiao$ cd Documents/EmailSpammer  
(base) Chikn:EmailSpammer michaelxiao$ chmod +x EmailSpammer.command  
(base) Chikn:EmailSpammer michaelxiao$
```

(Except in your case, ‘Chikn’ and ‘michaelxiao’ will be YOUR computer’s name and YOUR username, respectively)

You should not have gotten any errors if you followed my steps correctly up to this point. If you got any errors, review my steps and make sure you did them right. Or, shoot me a message on Facebook or Instagram! I'll be glad to help :)))

You are now done! You can now double click the [EmailSpammer.command](#) file to run the program. Have fun, but don't have too much fun ;)

---

## TERMS OF USE:

I am NOT responsible for any ruined friendships, black eyes, or angry 4 AM calls.

For actual programmers, you can change the command file to a python file and run it however you'd like. I changed it to a command file so non-programmers won't need to [cd](#) to the program folder each time and type [python EmailSpammer.py](#)

I made 0 class declarations, and I put all of the code in a single function. This means that my code is obviously “not very good”, and it can cause a lot of problems if I decide to add to it in the future LOL Feel free to clean it up if you'd like. Just don't hurt my feelings too much :'^)
